

Week 8 research

A clearfix is a way for an element to clear its child elements automatically without any additional markup. its property is generally used in float layouts where elements are floated to be stacked horizontally.

What I like about this week class is the CSS

It stands for Cascading Style Sheets. It is the what that gives a website its look and stylish layout. I also understood that CSS is fundamental to web design. Without it, websites would still be plain text on white backgrounds.

From the little history the development of CSS in 1996 by the World Wide Web Consortium (W3C), Web pages were extremely limited in both form and function. Early browsers presented a page as hypertext - plain text, images and links to other hypertext pages. There was no layout at all to speak of, merely paragraphs running across the page in a single column.
