

3 type of Html elements are

1. The opening tag (or start tag) marks where the element's content begins
2. The closing tag (or end tag) marks the end of the element's content
3. The content is placed between the element's opening and closing tags

My favorite thing I learned this week is that html elements can also contain attributes. which are extra code placed inside the opening tag of an element that provides additional information about the element. An attribute may be optional or required.
